

Solving Quadratic6.2343 Ec6.2343q(ua) 0.2 (t) 0.2 (i-0.2 (nsS) -0.2 by Comc6.2343pol) 0.2

4) You Try:

Using -substitution to Solve Quadratic Equations

1) Solve: $x^2 - 4x - 5 = 0$

$$a = \quad b = - \quad c = -$$

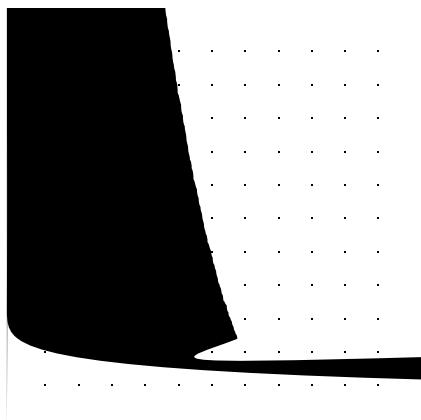

Substitute into the equation, then solve for .

$$\begin{aligned} (+ 2)^2 - 4(+ 2) - 5 &= 0 \\ ^2 + 4 + 4 - 4 - 8 - 5 &= 0 \\ ^2 - 9 &= 0 \\ ^2 &= 9 \\ &= \pm 3 \end{aligned}$$

Now substitute back:

$$\begin{array}{rcl} 2 \\ 3 - 2 \\ -3 - 2 \text{ or } 3 - 2 \\ -1 \text{ or } 5 \end{array}$$

Why this works: Look at the graph of the related function: $y = x^2 - 4x - 5$

Now substitute back:

In general, to solve for $ax^2 - bx - c = 0$, let ! —:

$$\begin{aligned} \frac{x^2}{2} + \frac{-b}{2} + \frac{c}{2} &= 0 \\ \frac{x^2}{4} + \frac{-b}{4} + \frac{c}{2} &= 0 \\ \frac{x^2}{4} + \frac{-b}{4} + \frac{c}{4} &= 0 \\ \frac{x^2}{4} + \frac{-b}{4} + \frac{c}{4} &= 0 \\ \frac{x^2}{4} + \frac{-b}{4} + \frac{c}{4} &= 0 \end{aligned}$$
